REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance: applicant recites a locomotive drive system having a plurality of direct current traction motors corresponding to a plurality of axles and a plurality of drive switches. Each traction motor operates in a drive mode or a free wheeling mode. When the motor is in the drive mode, power is provided by a power pulse from an energy storage device passes through the traction motor and a corresponding drive switch. When the motor is in the free wheeling mode the power pulse passes through the traction motor but bypasses the corresponding drive switch. The system also includes a plurality of filters where each filter corresponds to one of the plurality of traction motors to absorb electrical voltage transients and smooth current ripples through the traction motors resulting from changes between the drive mode and the free wheeling mode. A controller operates to determine a respective power requirement for each traction motor during a selected time interval and the necessary amplitude and pulse width of a power pulse to produce the determined power requirement for each traction motor, wherein during the selected time interval the respective power requirements of some traction motors are different.

The prior art made of reference, taken singularly or in combination, does not adequately disclose the features recited in the instant claims. Specifically the prior art of Kumar et al (US 6,612,245) does not disclose the use of a plurality of filters for use with each of the traction motors for absorbing energy when the traction motors switch between the respective modes. Kumar et al also does not disclose the control of the traction motors as recited in the instant claims.
